APPLICATION WALKTHROUGH

Verbal Coach

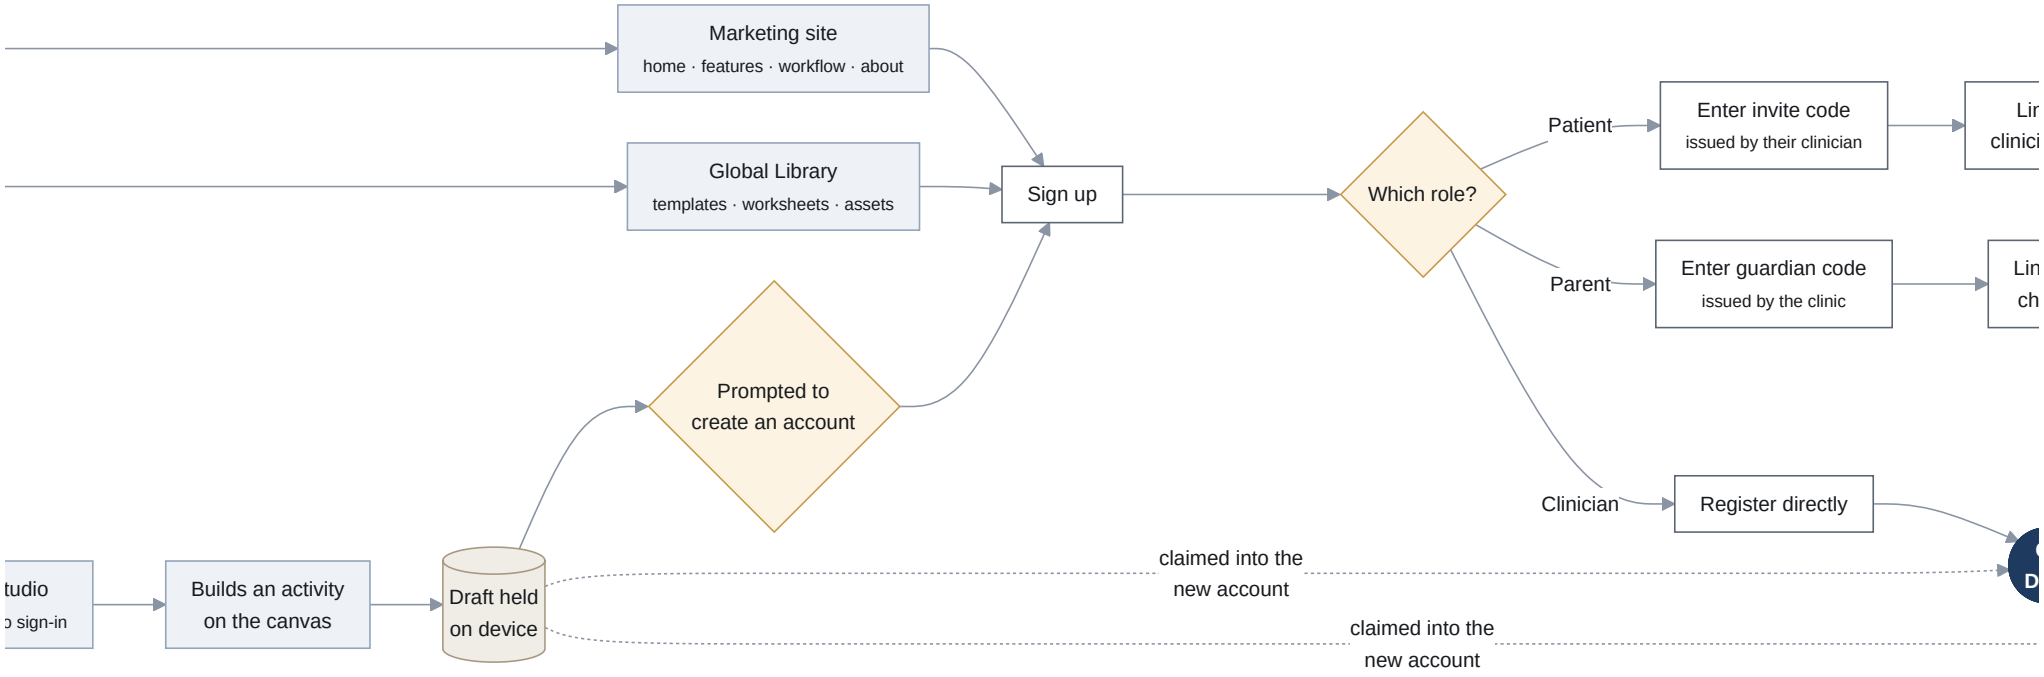

Every path through the platform, from a first-time visitor with no account to a completed activity appearing in a clinician's analytics.

1. Entry and account creation — how each of the three roles gets in
2. Clinician walkthrough — caseload, authoring, assigning, reviewing, billing
3. Patient walkthrough — receiving, completing, and being scored on an activity
4. Parent walkthrough — following a child and authoring home practice
5. Activity lifecycle — how a template becomes data a clinician can act on
6. Messaging and notifications — the communication layer across all roles

WALKTHROUGH · 1 OF 6

Entry and account creation

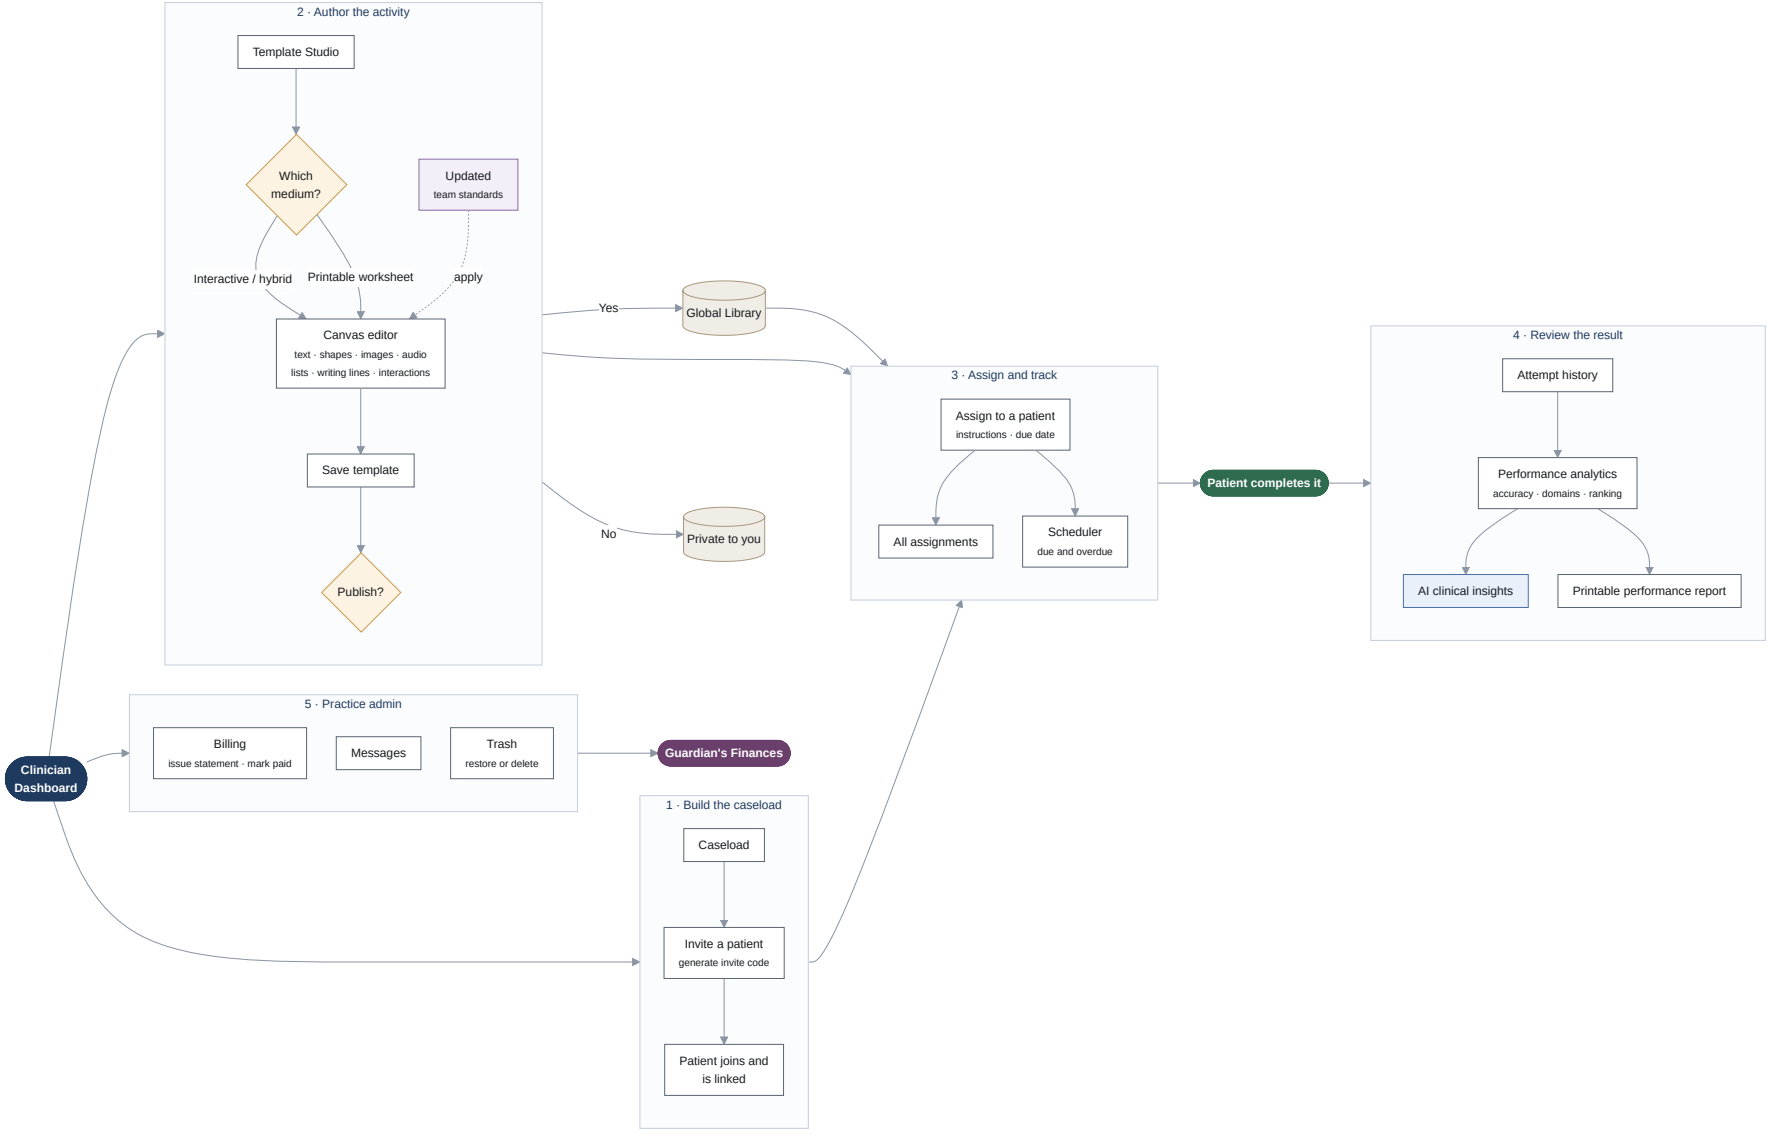

A visitor can use the canvas and browse the library before deciding to register. Patients and parents join by code; clinicians register directly.

Navy = clinician destination · Green = patient destination · Purple = parent destination · Amber = decision point · Grey = public, no account required

Clinician walkthrough

From dashboard to every working area of the practice: building a caseload, authoring activities, assigning them, reviewing results, and billing.

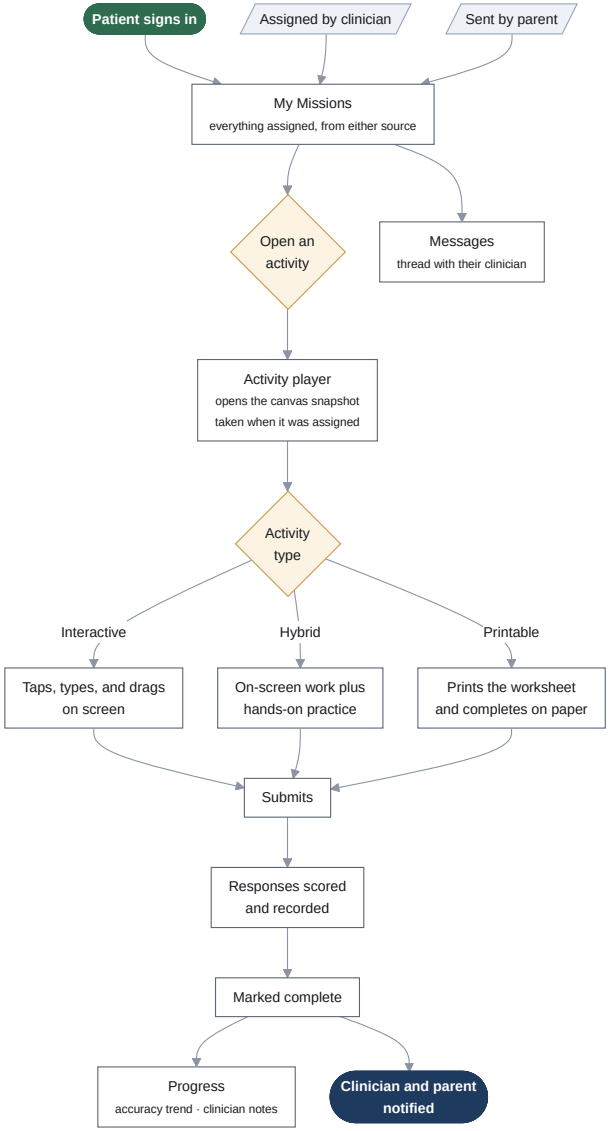

Blue = AI-assisted · Purple = shared authoring standards · Beige = stored state · Amber = decision point

WALKTHROUGH · 3 OF 6

Patient walkthrough

The patient sees one list of work regardless of who sent it, completes it in the player, and their result flows back to both the clinician and the parent.

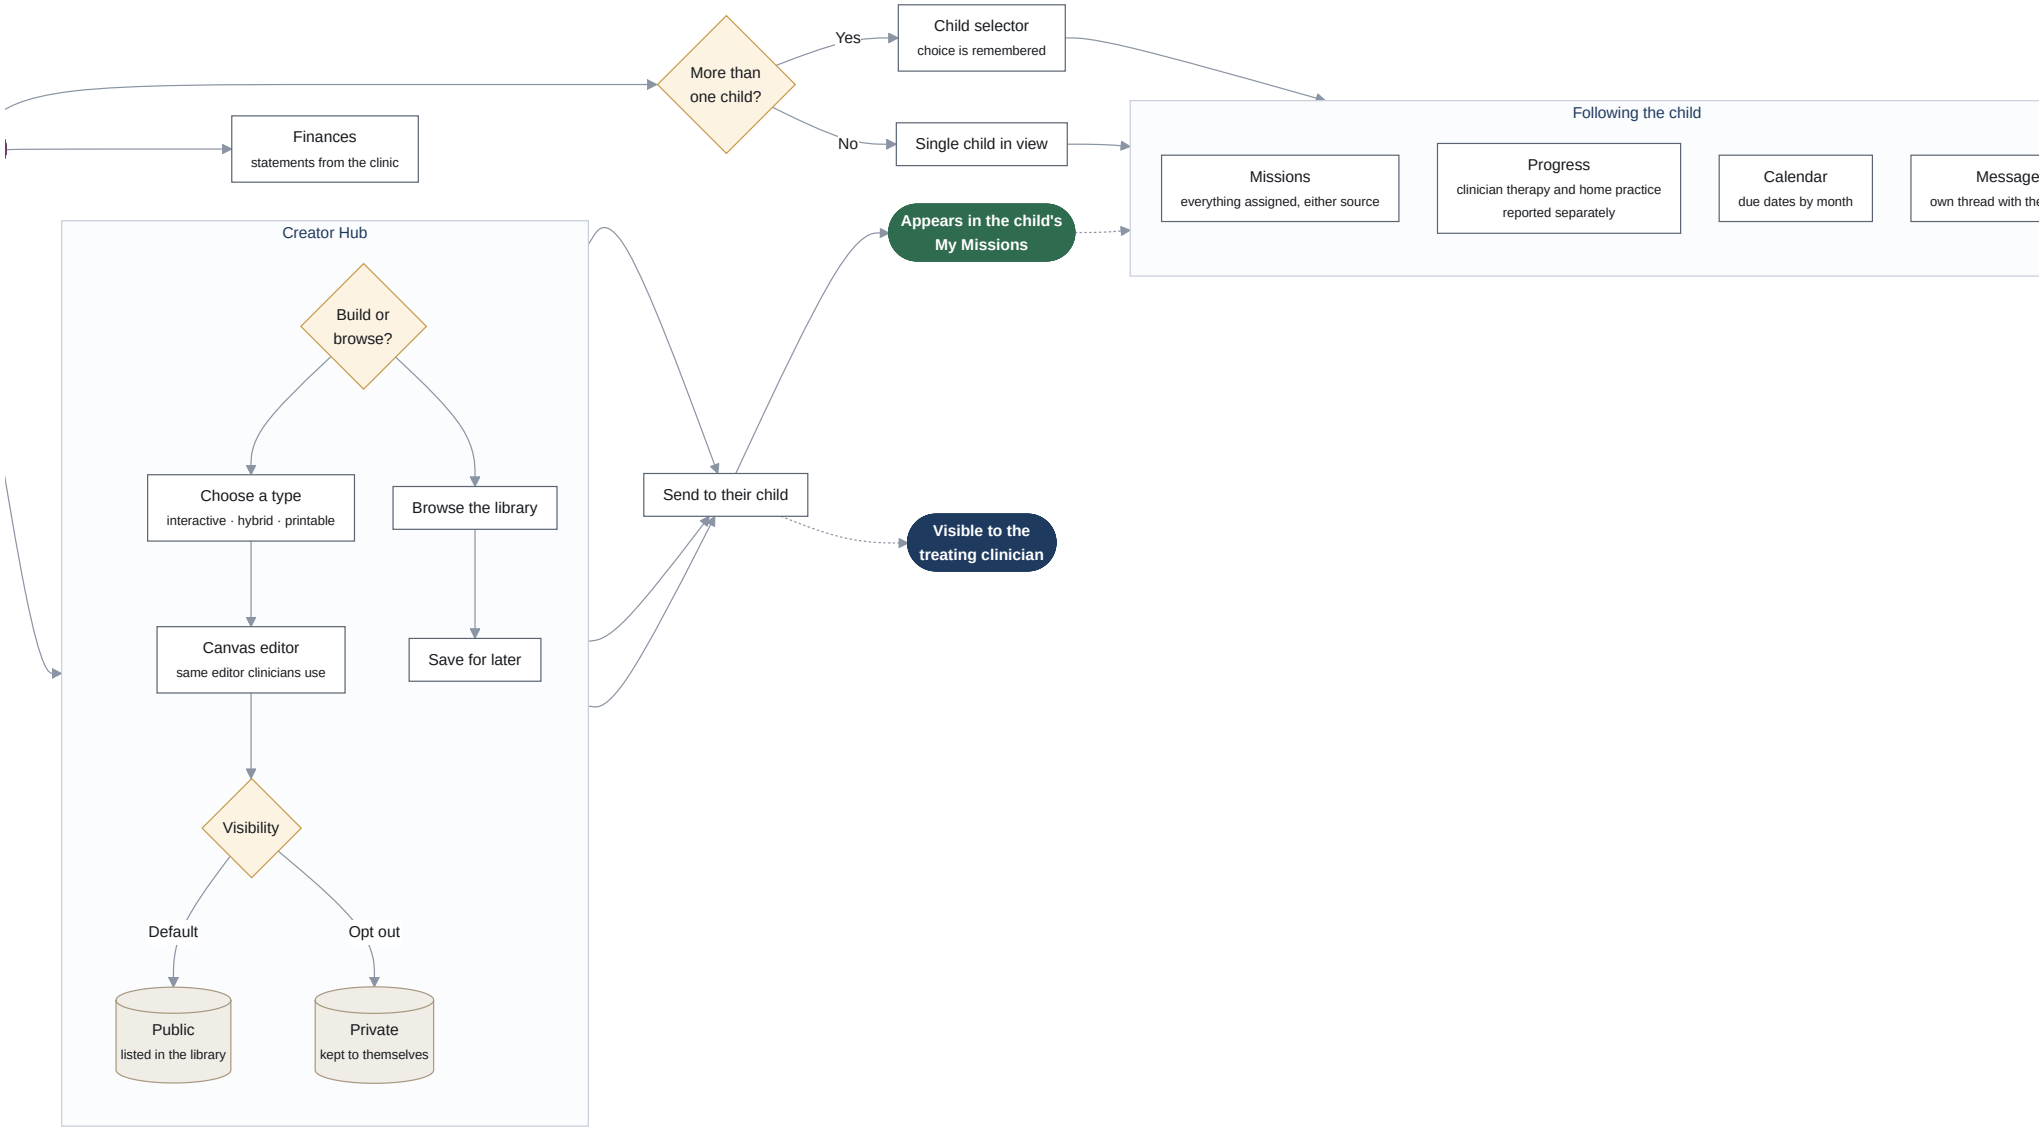

The activity opens from a snapshot taken at the moment it was assigned, so later edits to a template never change work already sent.

WALKTHROUGH · 4 OF 6

Parent and guardian walkthrough

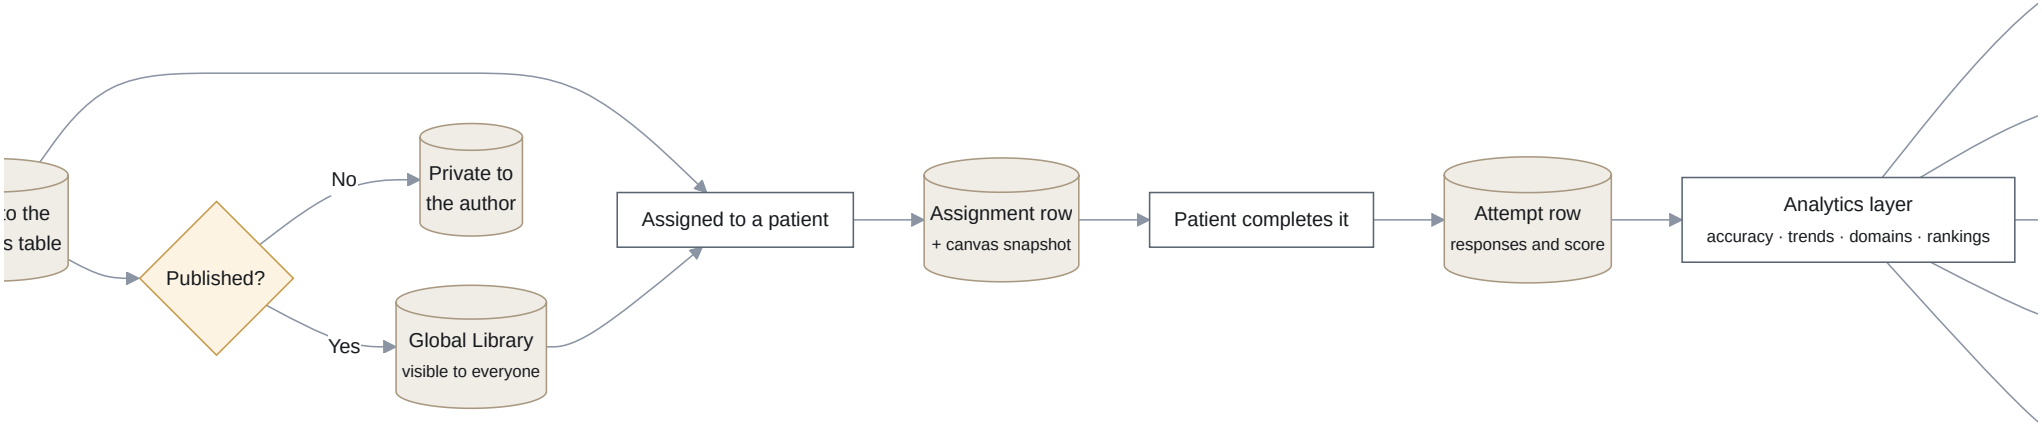

A guardian follows their child's therapy and contributes home practice of their own, authored on the same canvas the clinician uses.

Sending to your own child is independent of visibility — a private activity can still be assigned. Public means listed in the shared library.

Activity lifecycle

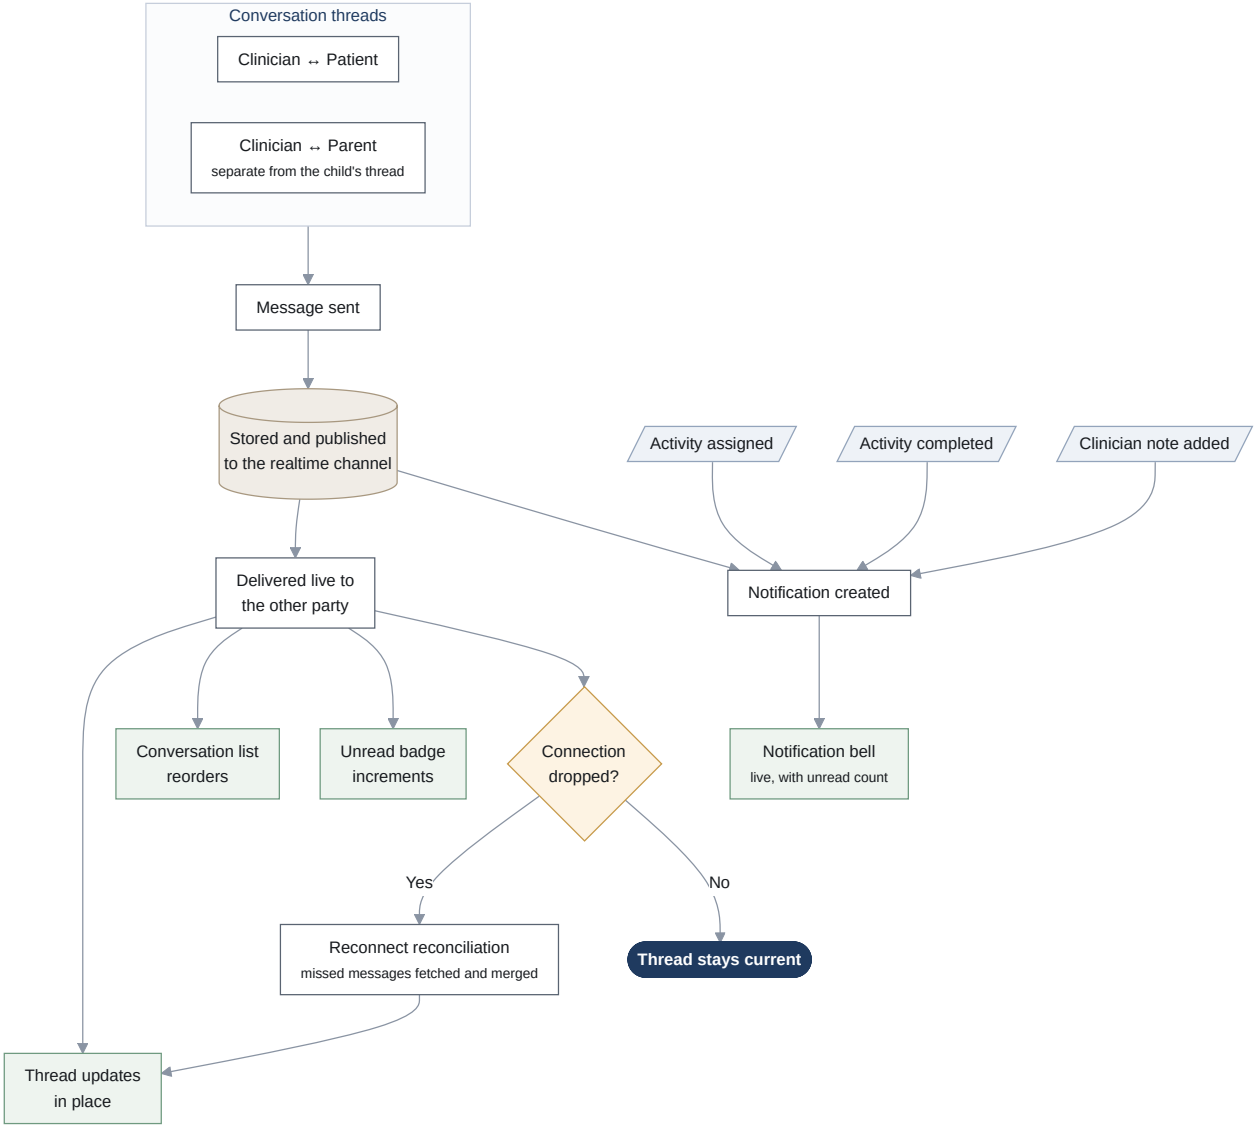

How an authored template becomes recorded evidence a clinician can act on, and where each piece of data comes to rest.

Beige = stored data · Green = reporting output · Blue = AI-assisted · Every table is governed by row-level security, so each role sees only what it is entitled to.

Messaging and notifications

The communication layer running underneath every role, delivered live rather than on refresh.

Messages survive a dropped connection: on reconnect, anything missed is fetched and merged into the thread in the correct order.
